

# File I

## Implementation

### 1 l3backend-basics Implementation

```
1 <*package>
```

Whilst there is a reasonable amount of code overlap between backends, it is much clearer to have the blocks more-or-less separated than run in together and DocStripped out in parts. As such, most of the following is set up on a per-backend basis, though there is some common code (again given in blocks not interspersed with other material).

All the file identifiers are up-front so that they come out in the right place in the files.

```
2 \ProvidesExplFile
3 <*dvipdfmx>
4   {l3backend-dvipdfmx.def}{2022-08-23}{}
5   {L3 backend support: dvipdfmx}
6 </dvipdfmx>
7 <*dvips>
8   {l3backend-dvips.def}{2022-08-23}{}
9   {L3 backend support: dvips}
10 </dvips>
11 <*dvisvgm>
12   {l3backend-dvisvgm.def}{2022-08-23}{}
13   {L3 backend support: dvisvgm}
14 </dvisvgm>
15 <*luatex>
16   {l3backend-luatex.def}{2022-08-23}{}
17   {L3 backend support: PDF output (LuaTeX)}
18 </luatex>
19 <*pdftex>
20   {l3backend-pdftex.def}{2022-08-23}{}
21   {L3 backend support: PDF output (pdfTeX)}
22 </pdftex>
23 <*xetex>
24   {l3backend-xetex.def}{2022-08-23}{}
25   {L3 backend support: XeTeX}
26 </xetex>
```

Check if the loaded kernel is at least enough to load this file. The kernel date has to be at least equal to `\ExplBackendFileDate` or later. If `\__kernel_dependency_version_check:Nn` doesn't exist we're loading in an older kernel, so it's an error anyway. With time, this test should vanish and only the dependency check should remain.

```
27 \cs_if_exist:NTF \__kernel_dependency_version_check:nn
28   {
29     \__kernel_dependency_version_check:nn {2021-02-18}
30 <dvipdfmx>   {l3backend-dvipdfmx.def}
31 <dvips>      {l3backend-dvips.def}
32 <dvisvgm>    {l3backend-dvisvgm.def}
33 <luatex>    {l3backend-luatex.def}
34 <pdftex>    {l3backend-pdftex.def}
35 <xetex>     {l3backend-xetex.def}
```

```

36 }
37 {
38   \cs_if_exist_use:cF { @latex@error } { \errmessage }
39   {
40     Mismatched-LaTeX-support-files~detected. \MessageBreak
41     Loading~aborted!
42   }
43   { \use:c { @ehd } }
44   \tex_endinput:D
45 }

```

The order of the backend code here is such that we get somewhat logical outcomes in terms of code sharing whilst keeping things readable. (Trying to mix all of the code by concept is almost unmanageable.) The key parts which are shared are

- Color support is either dvips-like or LuaTeX/pdfTeX-like.
- LuaTeX/pdfTeX and dvipdfmx/XqTeX share drawing routines.
- XqTeX is the same as dvipdfmx other than image size extraction so takes most of the same code.

`__kernel_backend_literal:e` The one shared function for all backends is access to the basic `\special` primitive: it has slightly odd expansion behaviour so a wrapper is provided.

```

__kernel_backend_literal:n
__kernel_backend_literal:x
46 \cs_new_eq:NN __kernel_backend_literal:e \tex_special:D
47 \cs_new_protected:Npn __kernel_backend_literal:n #1
48   { __kernel_backend_literal:e { \exp_not:n {#1} } }
49 \cs_generate_variant:Nn __kernel_backend_literal:n { x }

```

*(End definition for `__kernel_backend_literal:e`.)*

`__kernel_backend_first_shipout:n` We need to write at first shipout in a few places. As we want to use the most up-to-date method,

```

50 \cs_if_exist:NTF \@ifl@t@r
51   {
52     \@ifl@t@r \fmtversion { 2020-10-01 }
53     {
54       \cs_new_protected:Npn __kernel_backend_first_shipout:n #1
55         { \hook_gput_code:nnn { shipout / firstpage } { l3backend } {#1} }
56     }
57     { \cs_new_eq:NN __kernel_backend_first_shipout:n \AtBeginDvi }
58   }
59   { \cs_new_eq:NN __kernel_backend_first_shipout:n \use:n }

```

*(End definition for `__kernel_backend_first_shipout:n`.)*

## 1.1 dvips backend

```

60 <*dvips>

```

`__kernel_backend_literal_postscript:n` Literal PostScript can be included using a few low-level formats. Here, we use the form with no positioning: this is overall more convenient as a wrapper. Note that this does require that where position is important, an appropriate wrapper is included.

```

61 \cs_new_protected:Npn __kernel_backend_literal_postscript:n #1
62   { __kernel_backend_literal:n { ps:: #1 } }
63 \cs_generate_variant:Nn __kernel_backend_literal_postscript:n { x }

```

(End definition for `\_kernel_backend_literal_postscript:n`.)

`\_kernel_backend_postscript:n` PostScript data that does have positioning, and also applying a shift to `SDict` (which is not done automatically by `ps:` or `ps::`, in contrast to `!` or `"`).

```
64 \cs_new_protected:Npn \_kernel_backend_postscript:n #1
65   { \_kernel_backend_literal:n { ps: SDict ~ begin ~ #1 ~ end } }
66 \cs_generate_variant:Nn \_kernel_backend_postscript:n { x }
```

(End definition for `\_kernel_backend_postscript:n`.)

PostScript for the header: a small saving but makes the code clearer. This is held until the start of shipout such that a document with no actual output does not write anything.

```
67 \bool_if:NT \g__kernel_backend_header_bool
68   {
69     \_kernel_backend_first_shipout:n
70     { \_kernel_backend_literal:n { header = l3backend-dvips.pro } }
71   }
```

`\_kernel_backend_align_begin:` In `dvips` there is no built-in saving of the current position, and so some additional PostScript is required to set up the transformation matrix and also to restore it afterwards. Notice the use of the stack to save the current position “up front” and to move back to it at the end of the process. Notice that the `[begin]/[end]` pair here mean that we can use a run of PostScript statements in separate lines: not *required* but does make the code and output more clear.

```
72 \cs_new_protected:Npn \_kernel_backend_align_begin:
73   {
74     \_kernel_backend_literal:n { ps::[begin] }
75     \_kernel_backend_literal_postscript:n { currentpoint }
76     \_kernel_backend_literal_postscript:n { currentpoint~translate }
77   }
78 \cs_new_protected:Npn \_kernel_backend_align_end:
79   {
80     \_kernel_backend_literal_postscript:n { neg-exch~neg-exch~translate }
81     \_kernel_backend_literal:n { ps::[end] }
82   }
```

(End definition for `\_kernel_backend_align_begin:` and `\_kernel_backend_align_end:.`)

`\_kernel_backend_scope_begin:` Saving/restoring scope for general operations needs to be done with `dvips` positioning (try without to see this!). Thus we need the `ps:` version of the special here. As only the graphics state is ever altered within this pairing, we use the lower-cost `g`-versions.

```
83 \cs_new_protected:Npn \_kernel_backend_scope_begin:
84   { \_kernel_backend_literal:n { ps:gsave } }
85 \cs_new_protected:Npn \_kernel_backend_scope_end:
86   { \_kernel_backend_literal:n { ps:grestore } }
```

(End definition for `\_kernel_backend_scope_begin:` and `\_kernel_backend_scope_end:.`)

```
87 </dvips>
```

## 1.2 LuaTeX and pdfTeX backends

88 `<*luatex | pdftex>`

Both LuaTeX and pdfTeX write PDFs directly rather than via an intermediate file. Although there are similarities, the move of LuaTeX to have more code in Lua means we create two independent files using shared DocStrip code.

`\_kernel_backend_literal_pdf:n`  
`\_kernel_backend_literal_pdf:x`

This is equivalent to `\special{pdf:}` but the engine can track it. Without the `direct` keyword everything is kept in sync: the transformation matrix is set to the current point automatically. Note that this is still inside the text (BT ...ET block).

```
89 \cs_new_protected:Npn \_kernel_backend_literal_pdf:n #1
90 {
91 <*luatex>
92   \tex_pdfextension:D literal
93 </luatex>
94 <*pdftex>
95   \tex_pdfliteral:D
96 </pdftex>
97   { \exp_not:n {#1} }
98 }
99 \cs_generate_variant:Nn \_kernel_backend_literal_pdf:n { x }
```

(End definition for `\_kernel_backend_literal_pdf:n`.)

`\_kernel_backend_literal_page:n`

Page literals are pretty simple. To avoid an expansion, we write out by hand.

```
100 \cs_new_protected:Npn \_kernel_backend_literal_page:n #1
101 {
102 <*luatex>
103   \tex_pdfextension:D literal ~
104 </luatex>
105 <*pdftex>
106   \tex_pdfliteral:D
107 </pdftex>
108   page { \exp_not:n {#1} }
109 }
```

(End definition for `\_kernel_backend_literal_page:n`.)

`\_kernel_backend_scope_begin:`

Higher-level interfaces for saving and restoring the graphic state.

`\_kernel_backend_scope_end:`

```
110 \cs_new_protected:Npn \_kernel_backend_scope_begin:
111 {
112 <*luatex>
113   \tex_pdfextension:D save \scan_stop:
114 </luatex>
115 <*pdftex>
116   \tex_pdfsave:D
117 </pdftex>
118 }
119 \cs_new_protected:Npn \_kernel_backend_scope_end:
120 {
121 <*luatex>
122   \tex_pdfextension:D restore \scan_stop:
123 </luatex>
124 <*pdftex>
125   \tex_pdfrestore:D
```

```

126 </pdftex>
127 }

```

(End definition for `\_kernel_backend_scope_begin:` and `\_kernel_backend_scope_end:.`)

`\_kernel_backend_matrix:n` Here the appropriate function is set up to insert an affine matrix into the PDF. With `pdfTeX` and `LuaTeX` in direct PDF output mode there is a primitive for this, which only needs the rotation/scaling/skew part.

```

128 \cs_new_protected:Npn \_kernel_backend_matrix:n #1
129 {
130 <*luatex>
131 \tex_pdfextension:D setmatrix
132 </luatex>
133 <*pdftex>
134 \tex_pdfsetmatrix:D
135 </pdftex>
136 { \exp_not:n {#1} }
137 }
138 \cs_generate_variant:Nn \_kernel_backend_matrix:n { x }

```

(End definition for `\_kernel_backend_matrix:n.`)

```

139 </luatex | pdftex>

```

### 1.3 dvipdfmx backend

```

140 <*dvipdfmx | xetex>

```

The `dvipdfmx` shares code with the PDF mode one (using the common section to this file) but also with `XYTeX`. The latter is close to identical to `dvipdfmx` and so all of the code here is extracted for both backends, with some `clean up` for `XYTeX` as required.

`\_kernel_backend_literal_pdf:n` Undocumented but equivalent to `pdfTeX`'s `literal` keyword. It's similar to be not the same as the documented `contents` keyword as that adds a `q/Q` pair.

```

141 \cs_new_protected:Npn \_kernel_backend_literal_pdf:n #1
142 { \_kernel_backend_literal:n { pdf:literal~ #1 } }
143 \cs_generate_variant:Nn \_kernel_backend_literal_pdf:n { x }

```

(End definition for `\_kernel_backend_literal_pdf:n.`)

`\_kernel_backend_literal_page:n` Whilst the manual says this is like `literal direct` in `pdfTeX`, it closes the BT block!

```

144 \cs_new_protected:Npn \_kernel_backend_literal_page:n #1
145 { \_kernel_backend_literal:n { pdf:literal~direct~ #1 } }

```

(End definition for `\_kernel_backend_literal_page:n.`)

`\_kernel_backend_scope_begin:` Scoping is done using the backend-specific specials. We use the versions originally from `xdvipfmx (x:)` as these are well-tested “in the wild”.

```

146 \cs_new_protected:Npn \_kernel_backend_scope_begin:
147 { \_kernel_backend_literal:n { x:gsave } }
148 \cs_new_protected:Npn \_kernel_backend_scope_end:
149 { \_kernel_backend_literal:n { x:grestore } }

```

(End definition for `\_kernel_backend_scope_begin:` and `\_kernel_backend_scope_end:.`)

```

150 </dvipdfmx | xetex>

```

## 1.4 dvisvgm backend

151 `\*dvisvgm)`

`\_kernel_backend_literal_svg:n`  
`\_kernel_backend_literal_svg:x`

Unlike the other backends, the requirements for making SVG files mean that we can't conveniently transform all operations to the current point. That makes life a bit more tricky later as that needs to be accounted for. A new line is added after each call to help to keep the output readable for debugging.

152 `\cs_new_protected:Npn \_kernel_backend_literal_svg:n #1`  
 153 `{ \_kernel_backend_literal:n { dvisvgm:raw~ #1 { ?nl } } }`  
 154 `\cs_generate_variant:Nn \_kernel_backend_literal_svg:n { x }`

(End definition for `\_kernel_backend_literal_svg:n`.)

`\g_kernel_backend_scope_int`  
`\l_kernel_backend_scope_int`

In SVG, we need to track scope nesting as properties attach to scopes; that requires a pair of int registers.

155 `\int_new:N \g_kernel_backend_scope_int`  
 156 `\int_new:N \l_kernel_backend_scope_int`

(End definition for `\g_kernel_backend_scope_int` and `\l_kernel_backend_scope_int`.)

`\_kernel_backend_scope_begin:`  
`\_kernel_backend_scope_end:`  
`\_kernel_backend_scope_begin:n`  
`\_kernel_backend_scope_begin:x`  
`\_kernel_backend_scope:n`  
`\_kernel_backend_scope:x`

In SVG, the need to attach concepts to a scope means we need to be sure we will close all of the open scopes. That is easiest done if we only need an outer “wrapper” `begin/end` pair, and within that we apply operations as a simple scoped statements. To keep down the non-productive groups, we also have a `begin` version that does take an argument.

157 `\cs_new_protected:Npn \_kernel_backend_scope_begin:`  
 158 `{`  
 159 `\_kernel_backend_literal_svg:n { <g> }`  
 160 `\int_set_eq:NN`  
 161 `\l_kernel_backend_scope_int`  
 162 `\g_kernel_backend_scope_int`  
 163 `\group_begin:`  
 164 `\int_gset:Nn \g_kernel_backend_scope_int { 1 }`  
 165 `}`  
 166 `\cs_new_protected:Npn \_kernel_backend_scope_end:`  
 167 `{`  
 168 `\prg_replicate:nn`  
 169 `{ \g_kernel_backend_scope_int }`  
 170 `{ \_kernel_backend_literal_svg:n { </g> } }`  
 171 `\group_end:`  
 172 `\int_gset_eq:NN`  
 173 `\g_kernel_backend_scope_int`  
 174 `\l_kernel_backend_scope_int`  
 175 `}`  
 176 `\cs_new_protected:Npn \_kernel_backend_scope_begin:n #1`  
 177 `{`  
 178 `\_kernel_backend_literal_svg:n { <g ~ #1 > }`  
 179 `\int_set_eq:NN`  
 180 `\l_kernel_backend_scope_int`  
 181 `\g_kernel_backend_scope_int`  
 182 `\group_begin:`  
 183 `\int_gset:Nn \g_kernel_backend_scope_int { 1 }`  
 184 `}`  
 185 `\cs_generate_variant:Nn \_kernel_backend_scope_begin:n { x }`

```

186 \cs_new_protected:Npn \__kernel_backend_scope:n #1
187 {
188   \__kernel_backend_literal_svg:n { <g ~ #1 > }
189   \int_gincr:N \g__kernel_backend_scope_int
190 }
191 \cs_generate_variant:Nn \__kernel_backend_scope:n { x }

```

(End definition for \\_\_kernel\_backend\_scope\_begin: and others.)

```

192 </dvisvgm>
193 </package>

```

## 2 I3backend-box Implementation

```

194 <*package>
195 <@@=box>

```

### 2.1 dvips backend

```

196 <*dvips>

```

\\_\_box\_backend\_clip:N The `dvips` backend scales all absolute dimensions based on the output resolution selected and any `TeX` magnification. Thus for any operation involving absolute lengths there is a correction to make. See `normalscale` from `special.pro` for the variables, noting that here everything is saved on the stack rather than as a separate variable. Once all of that is done, the actual clipping is trivial.

```

197 \cs_new_protected:Npn \__box_backend_clip:N #1
198 {
199   \__kernel_backend_scope_begin:
200   \__kernel_backend_align_begin:
201   \__kernel_backend_literal_postscript:n { matrix-currentmatrix }
202   \__kernel_backend_literal_postscript:n
203     { Resolution~72~div~VResolution~72~div~scale }
204   \__kernel_backend_literal_postscript:n { DVImag-dup~scale }
205   \__kernel_backend_literal_postscript:x
206     {
207       0 ~
208       \dim_to_decimal_in_bp:n { \box_dp:N #1 } ~
209       \dim_to_decimal_in_bp:n { \box_wd:N #1 } ~
210       \dim_to_decimal_in_bp:n { -\box_ht:N #1 - \box_dp:N #1 } ~
211       rectclip
212     }
213   \__kernel_backend_literal_postscript:n { setmatrix }
214   \__kernel_backend_align_end:
215   \hbox_overlap_right:n { \box_use:N #1 }
216   \__kernel_backend_scope_end:
217   \skip_horizontal:n { \box_wd:N #1 }
218 }

```

(End definition for \\_\_box\_backend\_clip:N.)

\\_\_box\_backend\_rotate:Nn Rotating using `dvips` does not require that the box dimensions are altered and has a very convenient built-in operation. Zero rotation must be written as 0 not -0 so there is a quick test.

```

219 \cs_new_protected:Npn \__box_backend_rotate:Nn #1#2
220 { \exp_args:NNf \__box_backend_rotate_aux:Nn #1 { \fp_eval:n {#2} } }
221 \cs_new_protected:Npn \__box_backend_rotate_aux:Nn #1#2
222 {
223   \__kernel_backend_scope_begin:
224   \__kernel_backend_align_begin:
225   \__kernel_backend_literal_postscript:x
226   {
227     \fp_compare:nNnTF {#2} = \c_zero_fp
228     { 0 }
229     { \fp_eval:n { round ( -(#2) , 5 ) } } } ~
230   rotate
231   }
232   \__kernel_backend_align_end:
233   \box_use:N #1
234   \__kernel_backend_scope_end:
235 }

```

(End definition for `\__box_backend_rotate:Nn` and `\__box_backend_rotate_aux:Nn`.)

`\__box_backend_scale:Nnn` The dvips backend once again has a dedicated operation we can use here.

```

236 \cs_new_protected:Npn \__box_backend_scale:Nnn #1#2#3
237 {
238   \__kernel_backend_scope_begin:
239   \__kernel_backend_align_begin:
240   \__kernel_backend_literal_postscript:x
241   {
242     \fp_eval:n { round ( #2 , 5 ) } ~
243     \fp_eval:n { round ( #3 , 5 ) } ~
244     scale
245   }
246   \__kernel_backend_align_end:
247   \hbox_overlap_right:n { \box_use:N #1 }
248   \__kernel_backend_scope_end:
249 }

```

(End definition for `\__box_backend_scale:Nnn`.)

250 `</dvips>`

## 2.2 LuaTeX and pdfTeX backends

251 `<*luatex | pdftex>`

`\__box_backend_clip:N` The general method is to save the current location, define a clipping path equivalent to the bounding box, then insert the content at the current position and in a zero width box. The “real” width is then made up using a horizontal skip before tidying up. There are other approaches that can be taken (for example using XForm objects), but the logic here shares as much code as possible and uses the same conversions (and so same rounding errors) in all cases.

```

252 \cs_new_protected:Npn \__box_backend_clip:N #1
253 {
254   \__kernel_backend_scope_begin:
255   \__kernel_backend_literal_pdf:x
256   {

```

```

257     0~
258     \dim_to_decimal_in_bp:n { -\box_dp:N #1 } ~
259     \dim_to_decimal_in_bp:n { \box_wd:N #1 } ~
260     \dim_to_decimal_in_bp:n { \box_ht:N #1 + \box_dp:N #1 } ~
261     re~W~n
262   }
263   \hbox_overlap_right:n { \box_use:N #1 }
264   \__kernel_backend_scope_end:
265   \skip_horizontal:n { \box_wd:N #1 }
266 }

```

(End definition for `\__box_backend_clip:N`.)

```

\__box_backend_rotate:Nn
\__box_backend_rotate_aux:Nn
  \l__box_backend_cos_fp
  \l__box_backend_sin_fp

```

Rotations are set using an affine transformation matrix which therefore requires sine/cosine values not the angle itself. We store the rounded values to avoid rounding twice. There are also a couple of comparisons to ensure that `-0` is not written to the output, as this avoids any issues with problematic display programs. Note that numbers are compared to 0 after rounding.

```

267 \cs_new_protected:Npn \__box_backend_rotate:Nn #1#2
268 { \exp_args:Nnf \__box_backend_rotate_aux:Nn #1 { \fp_eval:n {#2} } }
269 \cs_new_protected:Npn \__box_backend_rotate_aux:Nn #1#2
270 {
271   \__kernel_backend_scope_begin:
272   \box_set_wd:Nn #1 { Opt }
273   \fp_set:Nn \l__box_backend_cos_fp { round ( cosd ( #2 ) , 5 ) }
274   \fp_compare:nNnT \l__box_backend_cos_fp = \c_zero_fp
275     { \fp_zero:N \l__box_backend_cos_fp }
276   \fp_set:Nn \l__box_backend_sin_fp { round ( sind ( #2 ) , 5 ) }
277   \__kernel_backend_matrix:x
278   {
279     \fp_use:N \l__box_backend_cos_fp \c_space_tl
280     \fp_compare:nNnTF \l__box_backend_sin_fp = \c_zero_fp
281       { 0~0 }
282     {
283       \fp_use:N \l__box_backend_sin_fp
284       \c_space_tl
285       \fp_eval:n { -\l__box_backend_sin_fp }
286     }
287     \c_space_tl
288     \fp_use:N \l__box_backend_cos_fp
289   }
290   \box_use:N #1
291   \__kernel_backend_scope_end:
292 }
293 \fp_new:N \l__box_backend_cos_fp
294 \fp_new:N \l__box_backend_sin_fp

```

(End definition for `\__box_backend_rotate:Nn` and others.)

```

\__box_backend_scale:Nnn

```

The same idea as for rotation but without the complexity of signs and cosines.

```

295 \cs_new_protected:Npn \__box_backend_scale:Nnn #1#2#3
296 {
297   \__kernel_backend_scope_begin:
298   \__kernel_backend_matrix:x

```

```

299     {
300       \fp_eval:n { round ( #2 , 5 ) } ~
301       0~0~
302       \fp_eval:n { round ( #3 , 5 ) }
303     }
304     \hbox_overlap_right:n { \box_use:N #1 }
305     \__kernel_backend_scope_end:
306   }

```

(End definition for \\_\_box\_backend\_scale:Nnn.)

```
307 </luatex | pdftex>
```

## 2.3 dvipdfmx/X<sub>Y</sub>TeX backend

```
308 <*dvipdfmx | xetex>
```

\\_\_box\_backend\_clip:N The code here is identical to that for LuaTeX/pdfTeX: unlike rotation and scaling, there is no higher-level support in the backend for clipping.

```

309 \cs_new_protected:Npn \__box_backend_clip:N #1
310 {
311   \__kernel_backend_scope_begin:
312   \__kernel_backend_literal_pdf:x
313   {
314     0~
315     \dim_to_decimal_in_bp:n { -\box_dp:N #1 } ~
316     \dim_to_decimal_in_bp:n { \box_wd:N #1 } ~
317     \dim_to_decimal_in_bp:n { \box_ht:N #1 + \box_dp:N #1 } ~
318     re~W~n
319   }
320   \hbox_overlap_right:n { \box_use:N #1 }
321   \__kernel_backend_scope_end:
322   \skip_horizontal:n { \box_wd:N #1 }
323 }

```

(End definition for \\_\_box\_backend\_clip:N.)

\\_\_box\_backend\_rotate:Nn \\_\_box\_backend\_rotate\_aux:Nn Rotating in dvipdfmx/X<sub>Y</sub>TeX can be implemented using either PDF or backend-specific code. The former approach however is not “aware” of the content of boxes: this means that any embedded links would not be adjusted by the rotation. As such, the backend-native approach is preferred: the code therefore is similar (though not identical) to the dvips version (notice the rotation angle here is positive). As for dvips, zero rotation is written as 0 not -0.

```

324 \cs_new_protected:Npn \__box_backend_rotate:Nn #1#2
325 { \exp_args:Nmf \__box_backend_rotate_aux:Nn #1 { \fp_eval:n {#2} } }
326 \cs_new_protected:Npn \__box_backend_rotate_aux:Nn #1#2
327 {
328   \__kernel_backend_scope_begin:
329   \__kernel_backend_literal:x
330   {
331     x:rotate~
332     \fp_compare:nNnTF {#2} = \c_zero_fp
333     { 0 }
334     { \fp_eval:n { round ( #2 , 5 ) } } }
335   }

```

```

336     \box_use:N #1
337     \__kernel_backend_scope_end:
338 }

```

(End definition for `\__box_backend_rotate:Nn` and `\__box_backend_rotate_aux:Nn`.)

`\__box_backend_scale:Nnn` Much the same idea for scaling: use the higher-level backend operation to allow for box content.

```

339 \cs_new_protected:Npn \__box_backend_scale:Nnn #1#2#3
340 {
341     \__kernel_backend_scope_begin:
342     \__kernel_backend_literal:x
343     {
344         x:scale~
345         \fp_eval:n { round ( #2 , 5 ) } ~
346         \fp_eval:n { round ( #3 , 5 ) }
347     }
348     \hbox_overlap_right:n { \box_use:N #1 }
349     \__kernel_backend_scope_end:
350 }

```

(End definition for `\__box_backend_scale:Nnn`.)

```

351 </dviPDFmx | xetex>

```

## 2.4 dvisvgm backend

```

352 <*dvisvgm>

```

`\__box_backend_clip:N`  
`\g__kernel_clip_path_int`

Clipping in SVG is more involved than with other backends. The first issue is that the clipping path must be defined separately from where it is used, so we need to track how many paths have applied. The naming here uses `l3cp` as the namespace with a number following. Rather than use a rectangular operation, we define the path manually as this allows it to have a depth: easier than the alternative approach of shifting content up and down using scopes to allow for the depth of the  $\TeX$  box and keep the reference point the same!

```

353 \cs_new_protected:Npn \__box_backend_clip:N #1
354 {
355     \int_gincr:N \g__kernel_clip_path_int
356     \__kernel_backend_literal_svg:x
357     { < clipPath-id = " l3cp \int_use:N \g__kernel_clip_path_int " > }
358     \__kernel_backend_literal_svg:x
359     {
360         <
361         path ~ d =
362         "
363             M ~ 0 ~
364             \dim_to_decimal:n { -\box_dp:N #1 } ~
365             L ~ \dim_to_decimal:n { \box_wd:N #1 } ~
366             \dim_to_decimal:n { -\box_dp:N #1 } ~
367             L ~ \dim_to_decimal:n { \box_wd:N #1 } ~
368             \dim_to_decimal:n { \box_ht:N #1 + \box_dp:N #1 } ~
369             L ~ 0 ~
370             \dim_to_decimal:n { \box_ht:N #1 + \box_dp:N #1 } ~
371             Z

```

```

372         "
373         />
374     }
375     \_kernel_backend_literal_svg:n
376     { < /clipPath > }

```

In general the SVG set up does not try to transform coordinates to the current point. For clipping we need to do that, so have a transformation here to get us to the right place, and a matching one just before the  $\TeX$  box is inserted to get things back on track. The clip path needs to come between those two such that if lines up with the current point, as does the  $\TeX$  box.

```

377     \_kernel_backend_scope_begin:n
378     {
379         transform =
380         "
381             translate ( { ?x } , { ?y } ) ~
382             scale ( 1 , -1 )
383         "
384     }
385     \_kernel_backend_scope:x
386     {
387         clip-path =
388         "url ( \c_hash_str l3cp \int_use:N \g__kernel_clip_path_int ) "
389     }
390     \_kernel_backend_scope:n
391     {
392         transform =
393         "
394             scale ( -1 , 1 ) ~
395             translate ( { ?x } , { ?y } ) ~
396             scale ( -1 , -1 )
397         "
398     }
399     \box_use:N #1
400     \_kernel_backend_scope_end:
401 }
402 \int_new:N \g__kernel_clip_path_int

```

(End definition for  $\_box\_backend\_clip:N$  and  $\_kernel\_clip\_path\_int$ .)

$\_box\_backend\_rotate:Nn$  Rotation has a dedicated operation which includes a centre-of-rotation optional pair. That can be picked up from the backend syntax, so there is no need to worry about the transformation matrix.

```

403 \cs_new_protected:Npn \_box_backend_rotate:Nn #1#2
404 {
405     \_kernel_backend_scope_begin:x
406     {
407         transform =
408         "
409             rotate
410             ( \fp_eval:n { round ( -(#2) , 5 ) } , ~ { ?x } , ~ { ?y } )
411         "
412     }
413     \box_use:N #1

```

```

414     \__kernel_backend_scope_end:
415 }

```

(End definition for \\_\_box\_backend\_rotate:Nn.)

\\_\_box\_backend\_scale:Nnn In contrast to rotation, we have to account for the current position in this case. That is done using a couple of translations in addition to the scaling (which is therefore done backward with a flip).

```

416 \cs_new_protected:Npn \__box_backend_scale:Nnn #1#2#3
417 {
418   \__kernel_backend_scope_begin:x
419   {
420     transform =
421     "
422       translate ( { ?x } , { ?y } ) ~
423       scale
424       (
425         \fp_eval:n { round ( -#2 , 5 ) } ,
426         \fp_eval:n { round ( -#3 , 5 ) }
427       ) ~
428       translate ( { ?x } , { ?y } ) ~
429       scale ( -1 )
430     "
431   }
432   \hbox_overlap_right:n { \box_use:N #1 }
433   \__kernel_backend_scope_end:
434 }

```

(End definition for \\_\_box\_backend\_scale:Nnn.)

```

435 </dvisvgm>

```

```

436 </package>

```

### 3 13backend-color Implementation

```

437 <*package>

```

```

438 <@@=color>

```

Color support is split into parts: collecting data from L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>, the color stack, general color, separations, and color for drawings. We have different approaches in each backend, and have some choices to make about dvipdfmx/X<sub>Y</sub>L<sub>A</sub>T<sub>E</sub>X in particular. Whilst it is in some ways convenient to use the same approach in multiple backends, the fact that dvipdfmx/X<sub>Y</sub>L<sub>A</sub>T<sub>E</sub>X is PDF-based means it (largely) sticks closer to direct PDF output.

#### 3.1 Collecting information from L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>

##### 3.1.1 dvips-style

```

439 <*dvisvgm | dvipdfmx | dvips | xetex>

```

\\_\_color\_backend\_pickup:N Allow for L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> color. Here, the possible input values are limited: dvips-style colors can be taken as-is. The x-type expansion is there to cover the case where xcolor is in use.

```

440 \cs_new_protected:Npn \__color_backend_pickup:N #1
441 {
442   \exp_args:NV \tl_if_head_is_space:nTF \current@color

```

```

443     {
444       \tl_set:Nn #1 { { gray } { 0 } }
445       \msg_warning:nx { color } { unhandled }
446       { \current@color }
447     }
448     {
449       \exp_last_unbraced:Nx \_color_backend_pickup:w
450       { \current@color } \s__color_stop #1
451     }
452   }
453   \cs_new_protected:Npn \_color_backend_pickup:w #1 ~ #2 \s__color_stop #3
454   { \tl_set:Nn #3 { {#1} {#2} } }

```

(End definition for \\_color\_backend\_pickup:N and \\_color\_backend\_pickup:w.)

```

455 </dvisvgm | dvipdfmx | dvips | xetex>

```

### 3.1.2 LuaTeX and pdfTeX

```

456 <*luatex | pdftex>

```

Same ideas, but with a different backend-dependent format.

```

\_color_backend_pickup:N
\_color_backend_pickup:w

```

```

457 \cs_new_protected:Npn \_color_backend_pickup:N #1
458 {
459   \exp_last_unbraced:Nx \_color_backend_pickup:w
460   { \current@color } ~ 0 ~ 0 ~ 0 \s__color_stop #1
461 }
462 \cs_new_protected:Npn \_color_backend_pickup:w
463 #1 ~ #2 ~ #3 ~ #4 ~ #5 ~ #6 \s__color_stop #7
464 {
465   \str_if_eq:nnTF {#2} { g }
466   { \tl_set:Nn #7 { { gray } {#1} } }
467   {
468     \str_if_eq:nnTF {#4} { rg }
469     { \tl_set:Nn #7 { { rgb } { #1 ~ #2 ~ #3 } } }
470     {
471       \str_if_eq:nnTF {#5} { k }
472       { \tl_set:Nn #7 { { cmyk } { #1 ~ #2 ~ #3 ~ #4 } } }
473       {
474         \tl_set:Nn #1 { { gray } { 0 } }
475         \msg_warning:nx { color } { unhandled }
476         { \current@color }
477       }
478     }
479   }
480 }

```

(End definition for \\_color\_backend\_pickup:N and \\_color\_backend\_pickup:w.)

```

481 </luatex | pdftex>

```

## 3.2 The color stack

For PDF-based engines, we have a color stack available inside the specials. This is used for concepts beyond color itself: it is needed to manage the graphics state generally. Although dvipdfmx/X<sub>Y</sub>TeX have multiple color stacks in recent releases, the way these

interact with the original single stack and with other graphic state operations means that currently it is not feasible to use the multiple stacks.

### 3.2.1 Common code

```
482 <*luatex | pdftex>
```

`\l__color_backend_stack_int` For tracking which stack is in use where multiple stacks are used: currently just pdfTeX/LuaTeX but at some future stage may also cover dvipdfmx/X<sub>Y</sub>TeX.

```
483 \int_new:N \l__color_backend_stack_int
```

(End definition for `\l__color_backend_stack_int`.)

```
484 </luatex | pdftex>
```

### 3.2.2 LuaTeX and pdfTeX

```
485 <*luatex | pdftex>
```

`\__kernel_color_backend_stack_init:Nnn`

```
486 \cs_new_protected:Npn \__kernel_color_backend_stack_init:Nnn #1#2#3
487 {
488   \int_const:Nn #1
489   {
490     <*luatex>
491     \tex_pdffeedback:D colorstackinit ~
492     </luatex>
493     <*pdftex>
494     \tex_pdfcolorstackinit:D
495     </pdftex>
496     \tl_if_blank:nF {#2} { #2 ~ }
497     {#3}
498   }
499 }
```

(End definition for `\__kernel_color_backend_stack_init:Nnn`.)

`\__kernel_color_backend_stack_push:nn`

`\__kernel_color_backend_stack_pop:n`

```
500 \cs_new_protected:Npn \__kernel_color_backend_stack_push:nn #1#2
501 {
502   <*luatex>
503   \tex_pdfextension:D colorstack ~
504   </luatex>
505   <*pdftex>
506   \tex_pdfcolorstack:D
507   </pdftex>
508   \int_eval:n {#1} ~ push ~ {#2}
509 }
510 \cs_new_protected:Npn \__kernel_color_backend_stack_pop:n #1
511 {
512   <*luatex>
513   \tex_pdfextension:D colorstack ~
514   </luatex>
515   <*pdftex>
516   \tex_pdfcolorstack:D
517   </pdftex>
```

```

518     \int_eval:n {#1} ~ pop \scan_stop:
519   }

```

(End definition for `\__kernel_color_backend_stack_push:nn` and `\__kernel_color_backend_stack_pop:n`.)

```

520 </luatex | pdftex>

```

### 3.3 General color

#### 3.3.1 dvips-style

```

521 < *dvips | dvisvgm>

```

Push the data to the stack. In the case of dvips also saves the drawing color in raw PostScript. The spot model is for handling data in classical format.

```

\__color_backend_select_cmyk:n
\__color_backend_select_gray:n
\__color_backend_select_named:n
\__color_backend_select_rgb:n
\__color_backend_select:n
\__color_backend_reset:
color.sc
522 \cs_new_protected:Npn \__color_backend_select_cmyk:n #1
523   { \__color_backend_select:n { cmyk ~ #1 } }
524 \cs_new_protected:Npn \__color_backend_select_gray:n #1
525   { \__color_backend_select:n { gray ~ #1 } }
526 \cs_new_protected:Npn \__color_backend_select_named:n #1
527   { \__color_backend_select:n { ~ #1 } }
528 \cs_new_protected:Npn \__color_backend_select_rgb:n #1
529   { \__color_backend_select:n { rgb ~ #1 } }
530 \cs_new_protected:Npn \__color_backend_select:n #1
531   {
532     \__kernel_backend_literal:n { color~push~ #1 }
533   < *dvips>
534     \__kernel_backend_postscript:n { /color.sc ~ { } ~ def }
535   < /dvips>
536   }
537 \cs_new_protected:Npn \__color_backend_reset:
538   { \__kernel_backend_literal:n { color~pop } }

```

(End definition for `\__color_backend_select_cmyk:n` and others. This function is documented on page ??.)

```

539 < /dvips | dvisvgm>

```

#### 3.3.2 LuaTeX and pdfTeX

```

540 < *luatex | pdftex>

```

```

\l__color_backend_fill_tl
\l__color_backend_stroke_tl
541 \tl_new:N \l__color_backend_fill_tl
542 \tl_new:N \l__color_backend_stroke_tl

```

(End definition for `\l__color_backend_fill_tl` and `\l__color_backend_stroke_tl`.)

Store the values then pass to the stack.

```

\__color_backend_select_cmyk:n
\__color_backend_select_gray:n
\__color_backend_select_rgb:n
\__color_backend_select:nn
\__color_backend_reset:
543 \cs_new_protected:Npn \__color_backend_select_cmyk:n #1
544   { \__color_backend_select:nn { #1 ~ k } { #1 ~ K } }
545 \cs_new_protected:Npn \__color_backend_select_gray:n #1
546   { \__color_backend_select:nn { #1 ~ g } { #1 ~ G } }
547 \cs_new_protected:Npn \__color_backend_select_rgb:n #1
548   { \__color_backend_select:nn { #1 ~ rg } { #1 ~ RG } }
549 \cs_new_protected:Npn \__color_backend_select:nn #1#2

```

```

550 {
551   \tl_set:Nn \l__color_backend_fill_tl {#1}
552   \tl_set:Nn \l__color_backend_stroke_tl {#2}
553   \__kernel_color_backend_stack_push:nn \l__color_backend_stack_int { #1 ~ #2 }
554 }
555 \cs_new_protected:Npn \__color_backend_reset:
556 { \__kernel_color_backend_stack_pop:n \l__color_backend_stack_int }

```

(End definition for `\__color_backend_select_cmyk:n` and others.)

```
557 </luatex | pdftex>
```

### 3.3.3 dvipdfmx/X<sub>q</sub>T<sub>E</sub>X

These backends have the most possible approaches: it recognises both `dvips`-based color specials and its own format, plus one can include PDF statements directly. Recent releases also have a color stack approach similar to `pdfTEX`. Of the stack methods, the dedicated the most versatile is the latter as it can cover all of the use cases we have. However, at present this interacts problematically with any color on the original stack. We therefore stick to a single-stack approach here.

```
558 <*dvipdfmx | xetex>
```

```

\__color_backend_select:n Using the single stack is relatively easy as there is only one route.
  \__color_backend_select_cmyk:n 559 \cs_new_protected:Npn \__color_backend_select:n #1
  \__color_backend_select_gray:n 560 { \__kernel_backend_literal:n { pdf : bc ~ [ #1 ] } }
  \__color_backend_select_rgb:n 561 \cs_new_eq:NN \__color_backend_select_cmyk:n \__color_backend_select:n
\__color_backend_reset: 562 \cs_new_eq:NN \__color_backend_select_gray:n \__color_backend_select:n
563 \cs_new_eq:NN \__color_backend_select_rgb:n \__color_backend_select:n
564 \cs_new_protected:Npn \__color_backend_reset:
565 { \__kernel_backend_literal:n { pdf : ec } }

```

(End definition for `\__color_backend_select:n` and others.)

```

\__color_backend_select_named:n For classical named colors, the only value we should get is Black.
566 \cs_new_protected:Npn \__color_backend_select_named:n #1
567 {
568   \str_if_eq:nnTF {#1} { Black }
569     { \__color_backend_select_gray:n { 0 } }
570     { \msg_error:nnn { color } { unknown-named-color } {#1} }
571 }
572 \msg_new:nnn { color } { unknown-named-color }
573 { Named-color~'#1'~is~not~known. }

```

(End definition for `\__color_backend_select_named:n`.)

```
574 </dvipdfmx | xetex>
```

## 3.4 Separations

Here, life gets interesting and we need essentially one approach per backend.

```
575 <*dvipdfmx | luatex | pdftex | xetex | dvips>
```

But we start with some functionality needed for both PostScript and PDF based backends.

`\g_color_backend_colorant_prop`

```
576 \prop_new:N \g_color_backend_colorant_prop
```

(End definition for `\g_color_backend_colorant_prop`.)

`\_color_backend_devicen_colorants:n`

`\_color_backend_devicen_colorants:w`

```
577 \cs_new:Npx \_color_backend_devicen_colorants:n #1
```

```
578 {
```

```
579   \exp_not:N \tl_if_blank:nF {#1}
```

```
580   {
```

```

Initialising here means creating a small header set up plus massaging some data. This comes about as we have to deal with PDF-focussed data, which makes most sense “higher-up”. The approach is based on ideas from <https://tex.stackexchange.com/q/560093> plus using the PostScript manual for other aspects.

```

For the generic case, we cannot use `/FunctionType 2` unfortunately, so we have to code that idea up in PostScript. Here, we will therefore assume that a range is *always* given. First, we count values in each argument: at the backend level, we can assume there are always well-behaved with spaces present.

```

664 \cs_new:Npn \__color_backend_separation_init:nnn #1#2#3
665 {
666   \exp_args:Ne \__color_backend_separation_init:nnnn

670 \cs_new:Npn \__color_backend_separation_init_count:n #1
671 { \int_eval:n { 0 \__color_backend_separation_init_count:w #1 ~ \s__color_stop } }
672 \cs_new:Npn \__color_backend_separation_init_count:w #1 ~ #2 \s__color_stop
673 {
674   +1
675   \tl_if_blank:nF {#2}
676   { \__color_backend_separation_init_count:w #2 \s__color_stop }
677 }

```

Now we implement the algorithm. In the terms in the PostScript manual, we have  $\mathbf{N} = 1$  and  $\mathbf{Domain} = [0 \ 1]$ , with  $\mathbf{Range}$  as #2,  $\mathbf{C0}$  as #3 and  $\mathbf{C1}$  as #4, with the number of output components in #1. So all we have to do is implement  $y_i = \mathbf{C0}_i + x(\mathbf{C1}_i - \mathbf{C0}_i)$  with lots of stack manipulation, then check the ranges. That's done by adding everything to the stack first, then using the fact we know all of the offsets. As manipulating the stack is tricky, we start by re-formatting the  $\mathbf{C0}$  and  $\mathbf{C1}$  arrays to be interleaved, and add a 0 to each pair: this is used to keep the stack of constant length while we are doing the first pass of mathematics. We then working through that list, calculating from the last to the first value before tidying up by removing all of the input values. We do that by first copying all of the final  $y$  values to the end of the stack, then rolling everything so we can pop the now-unneeded material.

```

678 \cs_new:Npn \__color_backend_separation_init:nnnn #1#2#3#4
679 {
680   \__color_backend_separation_init:w #3 ~ \s__color_stop #4 ~ \s__color_stop
681   \prg_replicate:nn {#1}
682   {
683     pop ~ 1 ~ index ~ neg ~ 1 ~ index ~ add ~
684     \int_eval:n { 3 * #1 } ~ index ~ mul ~
685     2 ~ index ~ add ~
686     \int_eval:n { 3 * #1 } ~ #1 ~ roll ~
687   }
688   \int_step_function:nnnN {#1} { -1 } { 1 }
689   \__color_backend_separation_init:n
690   \int_eval:n { 4 * #1 + 1 } ~ #1 ~ roll ~
691   \prg_replicate:nn { 3 * #1 + 1 } { pop ~ }
692   \tl_if_blank:nF {#2}
693   { \__color_backend_separation_init:nw {#1} #2 ~ \s__color_stop }
694 }
695 \cs_new:Npn \__color_backend_separation_init:w
696 #1 ~ #2 \s__color_stop #3 ~ #4 \s__color_stop
697 {
698   #1 ~ #3 ~ 0 ~
699   \tl_if_blank:nF {#2}
700   { \__color_backend_separation_init:w #2 \s__color_stop #4 \s__color_stop }

```

```

701 }
702 \cs_new:Npn \__color_backend_separation_init:n #1
703 { \int_eval:n { #1 * 2 } ~ index ~ }

```

Finally, we deal with the range limit if required. This is handled by splitting the range into pairs. It's then just a question of doing the comparisons, this time dropping everything except the desired result.

```

704 \cs_new:Npn \__color_backend_separation_init:nw #1#2 ~ #3 ~ #4 \s__color_stop

```

Initialising the PDF structures needs two parts: creating an object containing the “real” name of the Separation, then adding a reference to that to each page. We use a separate object for the tint transformation following the model in the PDF reference. The object here for the color needs to be named as that way it’s accessible to dvipdfmx/X<sub>q</sub>TeX.

### 3.5 Fill and stroke color

Here, dvipdfmx/X<sub>Y</sub>TeX we write direct PDF specials for the fill, and only use the stack for the stroke color (see above for comments on why we cannot use multiple stacks with these backends). LuaTeX and pdfTeX have mutple stacks that can deal with fill and stroke. For dvips we have to manage fill and stroke color ourselves. We also handle dvisvgm independently, as there we can create SVG directly.

962 <\*dvipdfmx | xetex>

```

Drawing (fill/stroke) color is handled in dvipdfmx/X<sub>Y</sub>TeX in the same way as LuaTeX/pdfTeX. We use the same approach as earlier, except the color stack is not involved so the generic direct PDF operation is used. There is no worry about the nature of strokes: everything is handled automatically.

```

## 4 I3backend-draw Implementation

```
1120 \*package
```

```
1121 \@@=draw
```

### 4.1 dvips backend

```
1122 \*dvips
```

`\_draw_backend_literal:n` The same as literal PostScript: same arguments about positioning apply her.

```
\_draw_backend_literal:x 1123 \cs_new_eq:MN \_draw_backend_literal:n \_kernel_backend_literal_postscript:n  
1124 \cs_generate_variant:Nn \_draw_backend_literal:n { x }
```

(End definition for `\_draw_backend_literal:n`.)

`\_draw_backend_begin:` The `ps::[begin]` special here deals with positioning but allows us to continue on to a matching `ps::[end]`: contrast with `ps:`, which positions but where we can't split material between separate calls. The `@beginspecial/@endspecial` pair are from `special.pro` and correct the scale and  $y$ -axis direction. In contrast to `pgf`, we don't save the current point: discussion with Tom Rokici suggested a better way to handle the necessary translations (see `\_draw_backend_box_use:Nnnnn`). (Note that `@beginspecial/@endspecial` forms a backend scope.) The `[begin]/[end]` lines are handled differently from the rest as they are conceptually different: not really drawing literals but instructions to `dvips` itself.

```
1125 \cs_new_protected:Npn \_draw_backend_begin:  
1126 {  
1127   \_kernel_backend_literal:n { ps::[begin] }  
1128   \_draw_backend_literal:n { @beginspecial }  
1129 }  
1130 \cs_new_protected:Npn \_draw_backend_end:  
1131 {  
1132   \_draw_backend_literal:n { @endspecial }  
1133   \_kernel_backend_literal:n { ps::[end] }  
1134 }
```

(End definition for `\_draw_backend_begin:` and `\_draw_backend_end:`.)

`\_draw_backend_scope_begin:` Scope here may need to contain saved definitions, so the entire memory rather than just the graphic state has to be sent to the stack.

```
\_draw_backend_scope_end: 1135 \cs_new_protected:Npn \_draw_backend_scope_begin:  
1136 { \_draw_backend_literal:n { save } }  
1137 \cs_new_protected:Npn \_draw_backend_scope_end:  
1138 { \_draw_backend_literal:n { restore } }
```

(End definition for `\_draw_backend_scope_begin:` and `\_draw_backend_scope_end:`.)

`\_draw_backend_moveto:nn` Path creation operations mainly resolve directly to PostScript primitive steps, with only the need to convert to bp. Notice that x-type expansion is included here to ensure that any variable values are forced to literals before any possible caching. There is no native rectangular path command (without also clipping, filling or stroking), so that task is done using a small amount of PostScript.

```

1139 \cs_new_protected:Npn \_draw_backend_moveto:nn #1#2
1140   {
1141     \_draw_backend_literal:x
1142     {
1143       \dim_to_decimal_in_bp:n {#1} ~
1144       \dim_to_decimal_in_bp:n {#2} ~ moveto
1145     }
1146   }
1147 \cs_new_protected:Npn \_draw_backend_lineto:nn #1#2
1148   {
1149     \_draw_backend_literal:x
1150     {

```

(End definition for `\_draw_backend_evenodd_rule:`, `\_draw_backend_nonzero_rule:`, and `\g__draw_draw_eor_bool.`)

`\__draw_backend_closepath:` Unlike PDF, PostScript doesn't track separate colors for strokes and other elements. It is also desirable to have the `clip` keyword after a stroke or fill. To achieve those outcomes, there is some work to do. For color, the stroke color is simple but the fill one has to be inserted by hand. For clipping, the required ordering is achieved using a TeX switch. All of the operations end with a new path instruction as they do not terminate (again in contrast to PDF).

```

(End definition for `\__draw_backend_dash_pattern:nn` and others.)

`\__draw_backend_cm:nmmm` In `dvips`, keeping the transformations in line with the engine is unfortunately not possible for scaling and rotations: even if we decompose the matrix into those operations, there is still no backend tracking (*cf.* `dvipdfmx/XYTeX`). Thus we take the shortest path available and simply dump the matrix as given.

```

1291 \cs_new_protected:Npn \__draw_backend_cm:nmmm #1#2#3#4
1292 {
1293   \__draw_backend_literal:n
1294   { [ #1 ~ #2 ~ #3 ~ #4 ~ 0 ~ 0 ] ~ concat }
1295 }

```

(End definition for `\__draw_backend_cm:nmmm`.)

`\__draw_backend_box_use:Nmmmm` Inside a picture `@beginspecial/@endspecial` are active, which is normally a good thing but means that the position and scaling would be off if the box was inserted directly. To deal with that, there are a number of possible approaches. The implementation here was suggested by Tom Rokici (author of `dvips`). We end the current special placement, then set the current point with a literal `[begin]`. As for general literals, we then use the stack to store the current point and move to it. To insert the required transformation, we have to flip the  $y$ -axis, once before and once after it. Then we get back to the `TeX` reference point to insert our content. The clean up has to happen in the right places, hence the `[begin]/[end]` pair around `restore`. Finally, we can return to “normal” drawing mode. Notice that the set up here is very similar to that in `\__draw_align_currentpoint_...`, but the ordering of saving and restoring is different (intermixed).

```

1296 \cs_new_protected:Npn \__draw_backend_box_use:Nmmmm #1#2#3#4#5
1297 {
1298   \__draw_backend_literal:n { @endspecial }

1300   \__draw_backend_literal:n { [begin] }
1301   \__draw_backend_literal:n { save }
1302   \__draw_backend_literal:n { currentpoint }
1303   \__draw_backend_literal:n { currentpoint~translate }
1304   \__draw_backend_cm:nmmm { 1 } { 0 } { 0 } { -1 }
1305   \__draw_backend_cm:nmmm {#2} {#3} {#4} {#5}
1306   \__draw_backend_cm:nmmm { 1 } { 0 } { 0 } { -1 }
1307   \__draw_backend_literal:n { neg~exch~neg~exch~translate }

```

```

1308   \_draw_backend_literal:n { [end] }
1309   \hbox_overlap_right:n { \box_use:N #1 }
1310   \_draw_backend_literal:n { [begin] }
1311   \_draw_backend_literal:n { restore }
1312   \_draw_backend_literal:n { [end] }
1313   \_draw_backend_literal:n { [begin] }
1314   \_draw_backend_literal:n { @beginspecial }
1315 }

```

(End definition for `\_draw_backend_box_use:Nnnnn`.)

```

1316 </dvips>

```

## 4.2 LuaTeX, pdfTeX, dvipdfmx and XeTeX

LuaTeX, pdfTeX, dvipdfmx and XeTeX directly produce PDF output and understand a shared set of specials for drawing commands.

```

1317 <*dvipdfmx | luatex | pdftex | xetex>

```

### 4.2.1 Drawing

`\_draw_backend_literal:n` Pass data through using a dedicated interface.

```

\_draw_backend_literal:x
1318 \cs_new_eq:NN \_draw_backend_literal:n \_kernel_backend_literal_pdf:n
1319 \cs_generate_variant:Nn \_draw_backend_literal:n { x }

```

(End definition for `\_draw_backend_literal:n`.)

`\_draw_backend_begin:` No special requirements here, so simply set up a drawing scope.

```

\_draw_backend_end:
1320 \cs_new_protected:Npn \_draw_backend_begin:
1321 { \_draw_backend_scope_begin: }
1322 \cs_new_protected:Npn \_draw_backend_end:
1323 { \_draw_backend_scope_end: }

```

(End definition for `\_draw_backend_begin:` and `\_draw_backend_end:.`)

`\_draw_backend_scope_begin:` Use the backend-level scope mechanisms.

```

\_draw_backend_scope_end:
1324 \cs_new_eq:NN \_draw_backend_scope_begin: \_kernel_backend_scope_begin:
1325 \cs_new_eq:NN \_draw_backend_scope_end: \_kernel_backend_scope_end:

```

(End definition for `\_draw_backend_scope_begin:` and `\_draw_backend_scope_end:.`)

`\_draw_backend_moveto:nn` Path creation operations all resolve directly to PDF primitive steps, with only the need to convert to bp.

```

\_draw_backend_lineto:nn
  \_draw_backend_curveto:nnnnn
  \_draw_backend_rectangle:nnnn
1326 \cs_new_protected:Npn \_draw_backend_moveto:nn #1#2
1327 {
1328   \_draw_backend_literal:x

1330 }
1331 \cs_new_protected:Npn \_draw_backend_lineto:nn #1#2
1332 {
1333   \_draw_backend_literal:x
1334   { \dim_to_decimal_in_bp:n {#1} ~ \dim_to_decimal_in_bp:n {#2} ~ l }
1335 }
1336 \cs_new_protected:Npn \_draw_backend_curveto:nnnnn #1#2#3#4#5#6
1337 {

```

```

1338   \_draw_backend_literal:x
1339   {
1340     \dim_to_decimal_in_bp:n {#1} ~ \dim_to_decimal_in_bp:n {#2} ~
1341     \dim_to_decimal_in_bp:n {#3} ~ \dim_to_decimal_in_bp:n {#4} ~
1342     \dim_to_decimal_in_bp:n {#5} ~ \dim_to_decimal_in_bp:n {#6} ~
1343     c
1344   }
1345 }
1346 \cs_new_protected:Npn \_draw_backend_rectangle:nnnn #1#2#3#4
1347 {
1348   \_draw_backend_literal:x
1349   {
1350     \dim_to_decimal_in_bp:n {#1} ~ \dim_to_decimal_in_bp:n {#2} ~
1351     \dim_to_decimal_in_bp:n {#3} ~ \dim_to_decimal_in_bp:n {#4} ~
1352     re
1353   }
1354 }

```

(End definition for `\_draw_backend_moveto:nn` and others.)

`\_draw_backend_evenodd_rule:` The even-odd rule here can be implemented as a simply switch.  
`\_draw_backend_nonzero_rule:`  
`\g__draw_draw_eor_bool`

```

1355 \cs_new_protected:Npn \_draw_backend_evenodd_rule:
1356   { \bool_gset_true:N \g__draw_draw_eor_bool }
1357 \cs_new_protected:Npn \_draw_backend_nonzero_rule:
1358   { \bool_gset_false:N \g__draw_draw_eor_bool }
1359 \bool_new:N \g__draw_draw_eor_bool

```

(End definition for `\_draw_backend_evenodd_rule:`, `\_draw_backend_nonzero_rule:`, and `\g__draw_draw_eor_bool`.)

`\_draw_backend_closepath:` Converting paths to output is again a case of mapping directly to PDF operations.

```

\__draw_backend_stroke: 1360 \cs_new_protected:Npn \_draw_backend_closepath:

1414 { \__draw_backend_literal:n { 2 ~ j } }

```

(End definition for `\_draw_backend_dash_pattern:nn` and others.)

`\_draw_backend_cm:nnnn` Another split here between LuaTeX/pdfTeX and dvipdfmx/X<sub>q</sub>TeX. In the former, we have a direct method to maintain alignment: the backend can use a matrix itself. For dvipdfmx/X<sub>q</sub>TeX, we can to decompose the matrix into rotations and a scaling, then use those operations as they are handled by the backend. (There is backend support for matrix operations in dvipdfmx/X<sub>q</sub>TeX, but as a matched pair so not suitable for the “stand alone” transformation set up here.) The specials used here are from xdvipdfmx originally: they are well-tested, but probably equivalent to the pdf: versions!

```

Internally, transformations for drawing are tracked as a matrix. Not all engines provide a way of dealing with this: if we use a raw matrix, the engine loses track of positions (for example for hyperlinks), and this is not desirable. They do, however, allow us to track rotations and scalings. Luckily, we can decompose any (two-dimensional) matrix into two rotations and a single scaling:

$$\begin{bmatrix} A & B \\ C & D \end{bmatrix} = \begin{bmatrix} \cos \beta & \sin \beta \\ -\sin \beta & \cos \beta \end{bmatrix} \begin{bmatrix} w_1 & 0 \\ 0 & w_2 \end{bmatrix} \begin{bmatrix} \cos \gamma & \sin \gamma \\ -\sin \gamma & \cos \gamma \end{bmatrix}$$

The parent matrix can be converted to

$$\begin{bmatrix} A & B \\ C & D \end{bmatrix} = \begin{bmatrix} E & H \\ -H & E \end{bmatrix} + \begin{bmatrix} F & G \\ G & -F \end{bmatrix}$$

From these, we can find that

$$\begin{aligned} \frac{w_1 + w_2}{2} &= \sqrt{E^2 + H^2} \\ \frac{w_1 - w_2}{2} &= \sqrt{F^2 + G^2} \\ \gamma - \beta &= \tan^{-1}(G/F) \\ \gamma + \beta &= \tan^{-1}(H/E) \end{aligned}$$

at which point we just have to do various pieces of re-arrangement to get all of the values. (See J. Blinn, *IEEE Comput. Graph. Appl.*, 1996, **16**, 82–88.) There is one wrinkle: the

PostScript (and PDF) way of specifying a transformation matrix exchanges where one would normally expect  $B$  and  $C$  to be.

(End definition for `\__draw_backend_cm_decompose:nnnnN` and others.)

`\__draw_backend_box_use:Nnnn` Inserting a  $\text{\TeX}$  box transformed to the requested position and using the current matrix is done using a mixture of  $\text{\TeX}$  and low-level manipulation. The offset can be handled by  $\text{\TeX}$ , so only any rotation/skew/scaling component needs to be done using the matrix operation. As this operation can never be cached, the scope is set directly not using the `draw` version.

```

### 4.3 dvisvgm backend

```

1511 <*dvisvgm>

```

\\_\_draw\_backend\_literal:n The same as the more general literal call.

```

\__draw_backend_literal:x
1512 \cs_new_eq:NN \__draw_backend_literal:n \__kernel_backend_literal_svg:n
1513 \cs_generate_variant:Nn \__draw_backend_literal:n { x }

```

(End definition for \\_\_draw\_backend\_literal:n.)

\\_\_draw\_backend\_scope\_begin: Use the backend-level scope mechanisms.

```

\__draw_backend_scope_end:
1514 \cs_new_eq:NN \__draw_backend_scope_begin: \__kernel_backend_scope_begin:
1515 \cs_new_eq:NN \__draw_backend_scope_end: \__kernel_backend_scope_end:

```

(End definition for \\_\_draw\_backend\_scope\_begin: and \\_\_draw\_backend\_scope\_end:.)

\\_\_draw\_backend\_begin: A drawing needs to be set up such that the co-ordinate system is translated. That is done inside a scope, which as described below

```

\__draw_backend_end:
1516 \cs_new_protected:Npn \__draw_backend_begin:
1517 {
1518   \__kernel_backend_scope_begin:
1519   \__kernel_backend_scope:n { transform="translate({?x},{?y})~scale(1,-1)" }
1520 }
1521 \cs_new_eq:NN \__draw_backend_end: \__kernel_backend_scope_end:

```

(End definition for \\_\_draw\_backend\_begin: and \\_\_draw\_backend\_end:.)

\\_\_draw\_backend\_moveto:nn Once again, some work is needed to get path constructs correct. Rather than write the values as they are given, the entire path needs to be collected up before being output in one go. For that we use a dedicated storage routine, which adds spaces as required. \\_\_draw\_backend\_lineto:nn Since paths should be fully expanded there is no need to worry about the internal x-type expansion. \\_\_draw\_backend\_rectangle:nnnnn \\_\_draw\_backend\_curveto:nnnnnn \\_\_draw\_backend\_add\_to\_path:n

\__draw_backend_fillstroke:
\__draw_backend_clip:
\__draw_backend_discardpath:
\g__draw_draw_clip_bool
\g__draw_draw_path_int

```

Setting fill and stroke effects and doing clipping all has to be done using scopes. This means setting up the various requirements in a shared auxiliary which deals with the bits and pieces. Clipping paths are reused for path drawing: not essential but avoids constructing them twice. Discarding a path needs a separate function as it's not quite the same.

```

```
1701 </divisvgn>
```

```
1702 </package>
```

## 5 l3backend-graphics Implementation

```

1703 <*package>
1704 <@=graphics>

```

`\_graphics_backend_loaded:n` To deal with file load ordering. Plain users are on their own.

```
1705 \cs_new_protected:Npn \_graphics_backend_loaded:n #1
```

```

1706 {
1707   \cs_if_exist:NTF \hook_gput_code:nnn
1708   {
1709     \hook_gput_code:nnn
1710     { file / l3graphics.sty / after }
1711     { backend }
1712     {#1}
1713   }
1714   {#1}
1715 }

```

(End definition for `\__graphics_backend_loaded:n`.)

## 5.1 dvips backend

```

1716 <dvips>

```

`\l_graphics_search_ext_seq`

```

1717 \__graphics_backend_loaded:n
1718 { \seq_set_from_clist:Nn \l_graphics_search_ext_seq { .eps , .ps } }

```

(End definition for `\l_graphics_search_ext_seq`. This variable is documented on page ??.)

`\__graphics_backend_getbb_eps:n`  
`\__graphics_backend_getbb_ps:n`

Simply use the generic function.

```

1719 \__graphics_backend_loaded:n
1720 {
1721   \cs_new_eq:NN \__graphics_backend_getbb_eps:n \__graphics_read_bb:n
1722   \cs_new_eq:NN \__graphics_backend_getbb_ps:n \__graphics_read_bb:n
1723 }

```

(End definition for `\__graphics_backend_getbb_eps:n` and `\__graphics_backend_getbb_ps:n`.)

`\__graphics_backend_include_eps:n`  
`\__graphics_backend_include_ps:n`

The special syntax is relatively clear here: remember we need PostScript sizes here.

```

1724 \cs_new_protected:Npn \__graphics_backend_include_eps:n #1
1725 {
1726   \__kernel_backend_literal:x
1727   {
1728     PSfile = #1 \c_space_tl
1729     llx = \dim_to_decimal_in_bp:n \l__graphics_llx_dim \c_space_tl
1730     lly = \dim_to_decimal_in_bp:n \l__graphics_lly_dim \c_space_tl
1731     urx = \dim_to_decimal_in_bp:n \l__graphics_urx_dim \c_space_tl
1732     ury = \dim_to_decimal_in_bp:n \l__graphics_ury_dim
1733   }
1734 }
1735 \cs_new_eq:NN \__graphics_backend_include_ps:n \__graphics_backend_include_eps:n

```

(End definition for `\__graphics_backend_include_eps:n` and `\__graphics_backend_include_ps:n`.)

`\__graphics_backend_get_pagecount:n`

```

1736 \__graphics_backend_loaded:n
1737 { \cs_new_eq:NN \__graphics_backend_get_pagecount:n \__graphics_get_pagecount:n }

```

(End definition for `\__graphics_backend_get_pagecount:n`.)

```

1738 </dvips>

```

## 5.2 LuaTeX and pdfTeX backends

1739 `{*luatex | pdftex}`

`\l_graphics_search_ext_seq`

```
1740 \__graphics_backend_loaded:n
1741 {
1742   \seq_set_from_clist:Nn

1745 }
```

(End definition for `\l_graphics_search_ext_seq`. This variable is documented on page ??.)

`\l_graphics_graphics_attr_tl`

In PDF mode, additional attributes of an graphic (such as page number) are needed both to obtain the bounding box and when inserting the graphic: this occurs as the graphic dictionary approach means they are read as part of the bounding box operation. As such, it is easier to track additional attributes using a dedicated `tl` rather than build up the same data twice.

```
1746 \tl_new:N \l__graphics_graphics_attr_tl
```

(End definition for `\l__graphics_graphics_attr_tl`.)

`\_graphics_backend_getbb_auxi:n`

`\_graphics_backend_getbb_auxii:n`

`\_graphics_backend_getbb_auxiii:n`

`\_graphics_backend_dequote:w`

Getting the bounding box here requires us to box up the graphic and measure it. To deal with the difference in feature support in bitmap and vector graphics but keeping the common parts, there is a little work to do in terms of auxiliaries. The key here is to notice that we need two forms of the attributes: a “short” set to allow us to track for caching, and the full form to pass to the primitive.

```
1747 \cs_new_protected:Npn \__graphics_backend_getbb_jpg:n #1
```

```

```

Measuring the graphic is done by boxing up: for PDF graphics we could use `\tex_pdfximagebbox:D`, but it doesn't work for other types. As the box always starts at (0,0) there is no need to worry about the lower-left position. Quotes need to be *removed* as LuaTeX does not like them here.

## 5.4 X<sub>Y</sub>T<sub>E</sub>X backend

```
1991 < *xetex >
```

For X<sub>Y</sub>T<sub>E</sub>X, there are two primitives that allow us to obtain the bounding box without needing `extractbb`. The only complexity is passing the various minor variations to a common core process. The X<sub>Y</sub>T<sub>E</sub>X primitive omits the text box from the page box specification, so there is also some “trimming” to do here.

2040     }
2041   \cs_new_protected:Npn \__graphics_backend_getbb_auxvi:nNnn #1#2#3#4
2042     {
2043       \hbox_set:Nn \l__graphics_internal_box { #2 #1 ~ #4 }
2044       \dim_set:Nn \l__graphics_urx_dim { \box_wd:N \l__graphics_internal_box }
2045       \dim_set:Nn \l__graphics_ury_dim { \box_ht:N \l__graphics_internal_box }
2046       \__graphics_bb_save:n {#1#3}
2047     }
2048   \cs_new:Npn \__graphics_backend_getbb_pagebox:w #1 box {#1}

```

(End definition for `\__graphics_backend_getbb_jpg:n` and others.)

`\__graphics_backend_include_pdf:n` For PDF graphics, properly supporting the `pagebox` concept in X<sub>Y</sub>TeX is best done using the `\tex_XeTeXpdffile:D` primitive. The syntax here is the same as for the graphic measurement part, although we know at this stage that there must be some valid setting for `\l__graphics_pagebox_tl`.

```

2049   \cs_new_protected:Npn \__graphics_backend_include_pdf:n #1
2050     {
2051       \tex_XeTeXpdffile:D #1 ~
2052       \int_compare:nNnT \l__graphics_page_int > 0
2053         { page ~ \int_use:N \l__graphics_page_int \c_space_tl }
2054       \exp_after:wN \__graphics_backend_getbb_pagebox:w \l__graphics_pagebox_tl
2055     }

```

(End definition for `\__graphics_backend_include_pdf:n`.)

`\__graphics_backend_get_pagecount:n` Very little to do here other than cover the case of a non-PDF file.

```

2056   \cs_new_protected:Npn \__graphics_backend_get_pagecount:n #1
2057     {
2058       \int_const:cn { c__graphics_#1_pages_int }
2059       {
2060         \int_max:nn
2061           { \int_use:N \tex_XeTeXpdfpagecount:D #1 ~ }
2062           { 1 }
2063       }
2064     }

```

(End definition for `\__graphics_backend_get_pagecount:n`.)

2065 `</xetex>`

## 5.5 dvisvgm backend

2066 `<*dvisvgm>`

`\l_graphics_search_ext_seq`

```

2067   \__graphics_backend_loaded:n
2068     {

```

```

2069 \seq_set_from_clist:Nn
2070 \l_graphics_search_ext_seq
2071 { .svg , .pdf , .eps , .ps , .png , .jpg , .jpeg }
2072 }

```

(End definition for `\l_graphics_search_ext_seq`. This variable is documented on page ??.)

This is relatively similar to reading bounding boxes for `.eps` files. Life is though made more tricky as we cannot pick a single line for the data. So we have to loop until we collect up both height and width. To do that, we can use a marker value. We also have to allow for the default units of the lengths: they are big points and may be omitted.

```

2184     ury = \dim_to_decimal_in_bp:n \l__graphics_ury_dim
2185   }
2186 }

```

(End definition for \\_\_graphics\_backend\_include\_eps:n and others.)

\\_\_graphics\_backend\_include\_svg:n \\_\_graphics\_backend\_include\_png:n \\_\_graphics\_backend\_include\_jpg:n \\_\_graphics\_backend\_include\_jpeg:n \\_\_graphics\_backend\_include\_dequote:w The backend here has built-in support for basic graphic inclusion (see dvisvgm.def for a more complex approach, needed if clipping, etc., is covered at the graphic backend level). We have to deal with the fact that the image reference point is at the top, so there is a need for a vertical shift to put it in the right place. The other issue is that #1 must be quote-corrected. The dvisvgm:img operation quotes the file name, but if it is already quoted (contains spaces) then we have an issue: we simply strip off any quotes as a result.

```

2187 \cs_new_protected:Npn \__graphics_backend_include_svg:n #1

```

## 6 I3backend-pdf Implementation

```

2212 <*package>
2213 <@@=pdf>

```

Setting up PDF resources is a complex area with only limited documentation in the engine manuals. The following code builds heavily on existing ideas from `hyperref` work by Sebastian Rahtz and Heiko Oberdiek, and significant contributions by Alexander Grahn, in addition to the specific code referenced a various points.

### 6.1 Shared code

A very small number of items that belong at the backend level but which are common to all backends.

`\l__pdf_internal_box`

```

2214 \box_new:N \l__pdf_internal_box

```

(End definition for `\l__pdf_internal_box`.)

### 6.2 dvips backend

```

2215 <*dvips>

```

`\_pdf_backend_pdfmark:n` Used often enough it should be a separate function.

```

\_pdf_backend_pdfmark:x
2216 \cs_new_protected:Npn \_pdf_backend_pdfmark:n #1
2217     { \_kernel_backend_postscript:n { mark #1 ~ pdfmark } }
2218 \cs_generate_variant:Nn \_pdf_backend_pdfmark:n { x }

```

(End definition for `\_pdf_backend_pdfmark:n`.)

## 6.2.1 Catalogue entries

```

\__pdf_backend_catalog_gput:nn
\__pdf_backend_info_gput:nn
2219 \cs_new_protected:Npn \__pdf_backend_catalog_gput:nn #1#2
2220 { \__pdf_backend_pdfmark:n { { Catalog } << /#1 ~ #2 >> /PUT } }
2221 \cs_new_protected:Npn \__pdf_backend_info_gput:nn #1#2
2222 { \__pdf_backend_pdfmark:n { /#1 ~ #2 /DOCINFO } }

(End definition for \__pdf_backend_catalog_gput:nn and \__pdf_backend_info_gput:nn.)

```

## 6.2.2 Objects

\g\_\_pdf\_backend\_object\_int For tracking objects to allow finalisation.

```

\g__pdf_backend_object_prop
2223 \int_new:N \g__pdf_backend_object_int
2224 \prop_new:N \g__pdf_backend_object_prop

(End definition for \g__pdf_backend_object_int and \g__pdf_backend_object_prop.)

```

\\_\_pdf\_backend\_object\_new:nn Tracking objects is similar to dvipdfmx.

```

\__pdf_backend_object_ref:nn
2225 \cs_new_protected:Npn \__pdf_backend_object_new:nn #1#2
2226 {
2227   \int_gincr:N \g__pdf_backend_object_int

```

(End definition for `\__pdf_backend_object_last:.`)

`\_pdf_backend_pageobject_ref:n` Page references are easy in dvips.

```

2317 \cs_new:Npn \_pdf_backend_pageobject_ref:n #1
2318 { { Page #1 } }

```

(End definition for `\_pdf_backend_pageobject_ref:n`.)

### 6.2.3 Annotations

In dvips, annotations have to be constructed manually. As such, we need the object code above for some definitions.

`\l__pdf_backend_content_box` The content of an annotation.

```

2319 \box_new:N \l__pdf_backend_content_box

```

(End definition for `\l__pdf_backend_content_box`.)

`\l__pdf_backend_model_box` For creating model sizing for links.

```

2320 \box_new:N \l__pdf_backend_model_box

```

(End definition for `\l__pdf_backend_model_box`.)

`\g__pdf_backend_annotation_int` Needed as objects which are not annotations could be created.

```

2321 \int_new:N \g__pdf_backend_annotation_int

```

(End definition for `\g__pdf_backend_annotation_int`.)

`\_pdf_backend_annotation:nnnn` Annotations are objects, but we track them separately. Notably, they are not in the object data lists. Here, to get the co-ordinates of the annotation, we need to have the data collected at the PostScript level. That requires a bit of box trickery (effectively a  $\LaTeX$  2<sub>ε</sub> `picture` of zero size). Once the data is collected, use it to set up the annotation border.

```

2322 \cs_new_protected:Npn \_pdf_backend_annotation:nnnn #1#2#3#4
2323 {
2324     \exp_args:Nf \_pdf_backend_annotation_aux:nnnn
2325     { \dim_eval:n {#1} } {#2} {#3} {#4}
2326 }
2327 \cs_new_protected:Npn \_pdf_backend_annotation_aux:nnnn #1#2#3#4
2328 {

```

```

2329 \box_move_down:nn {#3}
2330 { \hbox:n { \__kernel_backend_postscript:n { pdf.save.ll } } }
2331 \box_move_up:nn {#2}
2332 {
2333   \hbox:n
2334   {
2335     \__kernel_kern:n {#1}
2336     \__kernel_backend_postscript:n { pdf.save.ur }
2337     \__kernel_kern:n { -#1 }
2338   }
2339 }
2340 \int_gincr:N \g__pdf_backend_object_int
2341 \int_gset_eq:NN \g__pdf_backend_annotation_int \g__pdf_backend_object_int
2342 \__pdf_backend_pdfmark:x
2343 {
2344   /objdef { pdf.obj \int_use:N \g__pdf_backend_object_int }
2345   pdf.rect
2346   #4 ~
2347   /ANN
2348 }
2349 }

```

(End definition for `\__pdf_backend_annotation:mnm`.)

`\__pdf_backend_annotation_last:` Provide the last annotation we created: could get tricky of course if other packages are loaded.

```

2350 \cs_new:Npn \__pdf_backend_annotation_last:
2351 { { pdf.obj \int_use:N \g__pdf_backend_annotation_int } }

```

(End definition for `\__pdf_backend_annotation_last:`.)

`\g__pdf_backend_link_int` To track annotations which are links.

```

2352 \int_new:N \g__pdf_backend_link_int

```

(End definition for `\g__pdf_backend_link_int`.)

`\g__pdf_backend_link_dict_tl` To pass information to the end-of-link function.

```

2353 \tl_new:N \g__pdf_backend_link_dict_tl

```

(End definition for `\g__pdf_backend_link_dict_tl`.)

`\g__pdf_backend_link_sf_int` Needed to save/restore space factor, which is needed to deal with the face we need a box.

```

2354 \int_new:N \g__pdf_backend_link_sf_int

```

(End definition for `\g__pdf_backend_link_sf_int`.)

`\g__pdf_backend_link_math_bool` Needed to save/restore math mode.

```

2355 \bool_new:N \g__pdf_backend_link_math_bool

```

(End definition for `\g__pdf_backend_link_math_bool`.)

`\g__pdf_backend_link_bool` Track link formation: we cannot nest at all.

```

2356 \bool_new:N \g__pdf_backend_link_bool

```

(End definition for `\g__pdf_backend_link_bool`.)

`\l_pdf_breaklink_pdfmark_tl` Swappable content for link breaking.

```

2357 \tl_new:N \l_pdf_breaklink_pdfmark_tl
2358 \tl_set:Nn \l_pdf_breaklink_pdfmark_tl { pdfmark }

```

(End definition for `\l_pdf_breaklink_pdfmark_tl`.)

`\_pdf_breaklink_postscript:n` To allow dropping material unless link breaking is active.

```

2359 \cs_new_protected:Npn \_pdf_breaklink_postscript:n #1 { }

```

(End definition for `\_pdf_breaklink_postscript:n`.)

`\_pdf_breaklink_usebox:N` Swappable box unpacking or use.

```

2360 \cs_new_eq:MN \_pdf_breaklink_usebox:N \box_use:N

```

(End definition for `\_pdf_breaklink_usebox:N`.)

`\_pdf_backend_link_begin_goto:nmw` Links are crated like annotations but with dedicated code to allow for adjusting the size of the rectangle. In contrast to `hyperref`, we grab the link content as a box which can then unbox: this allows the same interface as for `pdfTeX`.

`\_pdf_backend_link_begin_user:nmw` Notice that the link setup here uses `/Action` not `/A`. That is because Distiller *requires* this trigger word, rather than a “raw” PDF dictionary key (Ghostscript can handle either form).

`\_pdf_backend_link:nw` Taking the idea of `evenboxes` from `hypdvips`, we implement a minimum box height and depth for link placement. This means that “underlining” with a hyperlink will generally give an even appearance. However, to ensure that the full content is always above the link border, we do not allow this to be negative (contrast `hypdvips` approach).

`\_pdf_backend_link_aux:nw` The result should be similar to `pdfTeX` in the vast majority of foreseeable cases.

`\_pdf_backend_link_end:` The object number for a link is saved separately from the rest of the dictionary as this allows us to insert it just once, at either an unbroken link or only in the first line of a broken one. That makes the code clearer but also avoids a low-level PostScript error with the code as taken from `hypdvips`.

`\_pdf_backend_link_end_aux:` Getting the outer dimensions of the text area may be better using a two-pass approach and `\tex_savepos:D`. That plus generic mode are still to re-examine.

`\_pdf_backend_link_minima:`

`\_pdf_backend_link_outerbox:n`

`\_pdf_backend_link_sf_save:`

`\_pdf_backend_link_sf_restore:`

`pdf.linkdp.pad`

`pdf.linkht.pad`

`pdf.llx`

`pdf.lly`

`pdf.ury`

`pdf.link.dict`

`pdf.outerbox`

`pdf.baselineskip`

```

## 6.3 LuaTeX and pdfTeX backend

```

2629 <*luatex | pdftex>

```

### 6.3.1 Annotations

`\__pdf_backend_annotation:nmmn` Simply pass the raw data through, just dealing with evaluation of dimensions.

```

2630 \cs_new_protected:Npn \__pdf_backend_annotation:nmmn #1#2#3#4
2631 {
2632   <*luatex>
2633   \tex_pdfextension:D annot ~
2634   </luatex>
2635   <*pdftex>
2636   \tex_pdfannot:D
2637   </pdftex>
2638   width ~ \dim_eval:n {#1} ~
2639   height ~ \dim_eval:n {#2} ~
2640   depth ~ \dim_eval:n {#3} ~
2641   {#4}
2642 }

```

(End definition for `\__pdf_backend_annotation:nmmn`.)

`\__pdf_backend_annotation_last:` A tiny amount of extra data gets added here; we use x-type expansion to get the space in the right place and form. The “extra” space in the LuaTeX version is *required* as it is consumed in finding the end of the keyword.

```

2643 \cs_new:Npx \__pdf_backend_annotation_last:
2644 {
2645   \exp_not:N \int_value:w
2646   <*luatex>

```

```

2647     \exp_not:N \tex_pdffeedback:D lastannot ~
2648 </luatex>
2649 <*pdftex>
2650     \exp_not:N \tex_pdflastannot:D
2651 </pdftex>
2652     \c_space_tl 0 ~ R
2653 }

```

(End definition for \\_pdf\_backend\_annotation\_last:.)

```

\_pdf_backend_link_begin_goto:nw Links are all created using the same internals.
\_pdf_backend_link_begin_user:nw
  \_pdf_backend_link_begin:nnw
\_pdf_backend_link_end:
2654 \cs_new_protected:Npn \_pdf_backend_link_begin_goto:nw #1#2
2655   { \_pdf_backend_link_begin:nnw {#1} { goto~name } {#2} }
2656 \cs_new_protected:Npn \_pdf_backend_link_begin_user:nw #1#2
2657   { \_pdf_backend_link_begin:nnw {#1} { user } {#2} }
2658 \cs_new_protected:Npn \_pdf_backend_link_begin:nnw #1#2#3
2659   {
2660 <*luatex>
2661     \tex_pdfextension:D startlink ~
2662 </luatex>
2663 <*pdftex>
2664     \tex_pdfstartlink:D
2665 </pdftex>
2666     attr {#1}
2667     #2 {#3}
2668   }
2669 \cs_new_protected:Npn \_pdf_backend_link_end:
2670   {
2671 <*luatex>
2672     \tex_pdfextension:D endlink \scan_stop:
2673 </luatex>
2674 <*pdftex>
2675     \tex_pdfendlink:D
2676 </pdftex>
2677   }

```

(End definition for \\_pdf\_backend\_link\_begin\_goto:nw and others.)

\\_pdf\_backend\_link\_last: Formatted for direct use.

```

2678 \cs_new:Npx \_pdf_backend_link_last:
2679   {
2680     \exp_not:N \int_value:w
2681 <*luatex>
2682     \exp_not:N \tex_pdffeedback:D lastlink ~
2683 </luatex>
2684 <*pdftex>
2685     \exp_not:N \tex_pdflastlink:D
2686 </pdftex>
2687     \c_space_tl 0 ~ R
2688   }

```

(End definition for \\_pdf\_backend\_link\_last:.)

`\_pdf_backend_link_margin:n` A simple task: pass the data to the primitive.

```
2689 \cs_new_protected:Npn \_pdf_backend_link_margin:n #1
2690 {
2691 <*luatex>
2692   \tex_pdfvariable:D linkmargin
2693 </luatex>
2694 <*pdftex>
2695   \tex_pdflinkmargin:D
2696 </pdftex>
2697   \dim_eval:n {#1} \scan_stop:
2698 }
```

(End definition for `\_pdf_backend_link_margin:n`.)

`\_pdf_backend_destination:nn` A simple task: pass the data to the primitive. The `\scan_stop:` deals with the danger of an unterminated keyword. The zoom given here is a percentage, but we need to pass it as *per mille*. The rectangle version is also easy as everything is build in.

`\_pdf_backend_destination:nnnn`

```
2699 \cs_new_protected:Npn \_pdf_backend_destination:nn #1#2
2700 {
2701 <*luatex>
2702   \tex_pdfextension:D dest ~
2703 </luatex>
2704 <*pdftex>
2705   \tex_pdfdest:D
2706 </pdftex>
2707   name {#1}
2708   \str_case:nnF {#2}
2709   {
2710     { xyz } { xyz }
2711     { fit } { fit }
2712     { fitb } { fitb }
2713     { fitbh } { fitbh }
2714     { fitbv } { fitbv }
2715     { fith } { fith }
2716     { fitv } { fitv }
2717     { fitr } { fitr }
2718   }
2719   { xyz ~ zoom \fp_eval:n { #2 * 10 } }
2720   \scan_stop:
2721 }
2722 \cs_new_protected:Npn \_pdf_backend_destination:nnnn #1#2#3#4
2723 {
2724 <*luatex>
2725   \tex_pdfextension:D dest ~
2726 </luatex>
2727 <*pdftex>
2728   \tex_pdfdest:D
2729 </pdftex>
2730   name {#1}
2731   fitr ~
2732   width \dim_eval:n {#2} ~
2733   height \dim_eval:n {#3} ~
2734   depth \dim_eval:n {#4} \scan_stop:
2735 }
```

(End definition for `\_pdf_backend_destination:nn` and `\_pdf_backend_destination:nnnn`.)

### 6.3.2 Catalogue entries

```
\_pdf_backend_catalog_gput:nn
\_pdf_backend_info_gput:nn
2736 \cs_new_protected:Npn \_pdf_backend_catalog_gput:nn #1#2
2737 {
2738   \*luatex
2739   \tex_pdfextension:D catalog
2740 \*luatex
2741 \*pdftex
2742 \tex_pdfcatalog:D
2743 \*pdftex
2744 { / #1 ~ #2 }
2745 }
2746 \cs_new_protected:Npn \_pdf_backend_info_gput:nn #1#2
2747 {
2748   \*luatex
2749   \tex_pdfextension:D info
2750 \*luatex
2751 \*pdftex
2752 \tex_pdfinfo:D
2753 \*pdftex
2754 { / #1 ~ #2 }
2755 }
```

(End definition for `\_pdf_backend_catalog_gput:nn` and `\_pdf_backend_info_gput:nn`.)

### 6.3.3 Objects

`\g_pdf_backend_object_prop` For tracking objects to allow finalisation.

```
2756 \prop_new:N \g_pdf_backend_object_prop
```

(End definition for `\g_pdf_backend_object_prop`.)

`\_pdf_backend_object_new:nn` Declaring objects means reserving at the PDF level plus starting tracking.

```
\_pdf_backend_object_ref:n
2757 \cs_new_protected:Npn \_pdf_backend_object_new:nn #1#2
2758 {
2759   \*luatex

2856 }

```

(End definition for \\_\_pdf\_backend\_pageobject\_ref:n.)

### 6.3.4 Structure

\\_\_pdf\_backend\_compresslevel:n Simply pass data to the engine.

```

\__pdf_backend_compress_objects:n
\__pdf_backend_objcompresslevel:n
2857 \cs_new_protected:Npn \__pdf_backend_compresslevel:n #1
2858 {
2859     \tex_global:D
2860     < *luatex >
2861     \tex_pdfvariable:D compresslevel

```

```

2862 </luatex>
2863 <*pdftex>
2864     \tex_pdfcompresslevel:D
2865 </pdftex>
2866     \int_value:w \int_eval:n {#1} \scan_stop:
2867 }
2868 \cs_new_protected:Npn \__pdf_backend_compress_objects:n #1
2869 {
2870     \bool_if:nTF {#1}
2871         { \__pdf_backend_objcompresslevel:n { 2 } }
2872         { \__pdf_backend_objcompresslevel:n { 0 } }
2873 }
2874 \cs_new_protected:Npn \__pdf_backend_objcompresslevel:n #1
2875 {
2876     \tex_global:D
2877 <*luatex>
2878     \tex_pdfvariable:D objcompresslevel
2879 </luatex>
2880 <*pdftex>
2881     \tex_pdfobjcompresslevel:D
2882 </pdftex>
2883     #1 \scan_stop:
2884 }

```

(End definition for \\_\_pdf\_backend\_compresslevel:n, \\_\_pdf\_backend\_compress\_objects:n, and \\_\_pdf\_backend\_objcompresslevel:n.)

\\_\_pdf\_backend\_version\_major\_gset:n  
 \\_\_pdf\_backend\_version\_minor\_gset:n

The availability of the primitive is not universal, so we have to test at load time.

```

2885 \cs_new_protected:Npx \__pdf_backend_version_major_gset:n #1
2886 {
2887 <*luatex>
2888     \int_compare:nNnT \tex_luatexversion:D > { 106 }
2889     {
2890         \exp_not:N \tex_global:D \tex_pdfvariable:D majorversion
2891         \exp_not:N \int_eval:n {#1} \scan_stop:
2892     }
2893 </luatex>
2894 <*pdftex>
2895     \cs_if_exist:NT \tex_pdfmajorversion:D
2896     {
2897         \exp_not:N \tex_global:D \tex_pdfmajorversion:D
2898         \exp_not:N \int_eval:n {#1} \scan_stop:
2899     }
2900 </pdftex>
2901 }
2902 \cs_new_protected:Npn \__pdf_backend_version_minor_gset:n #1
2903 {
2904     \tex_global:D
2905 <*luatex>
2906     \tex_pdfvariable:D minorversion
2907 </luatex>
2908 <*pdftex>
2909     \tex_pdfminorversion:D
2910 </pdftex>

```

```

2911         \int_eval:n {#1} \scan_stop:
2912     }

```

(End definition for `\_pdf_backend_version_major_gset:n` and `\_pdf_backend_version_minor_gset:n`.)

`\_pdf_backend_version_major:` As above.

```

\_pdf_backend_version_minor:
2913 \cs_new:Npx \_pdf_backend_version_major:
2914 {
2915 <*luatex>
2916     \int_compare:nNnTF \tex luatexversion:D > { 106 }
2917     { \exp_not:N \tex_the:D \tex_pdfvariable:D majorversion }
2918     { 1 }
2919 </luatex>
2920 <*pdftex>
2921     \cs_if_exist:NTF \tex_pdfmajorversion:D
2922     { \exp_not:N \tex_the:D \tex_pdfmajorversion:D }
2923     { 1 }
2924 </pdftex>
2925 }
2926 \cs_new:Npn \_pdf_backend_version_minor:
2927 {
2928     \tex_the:D
2929 <*luatex>
2930     \tex_pdfvariable:D minorversion
2931 </luatex>
2932 <*pdftex>
2933     \tex_pdfminorversion:D
2934 </pdftex>
2935 }

```

(End definition for `\_pdf_backend_version_major:` and `\_pdf_backend_version_minor:.`)

### 6.3.5 Marked content

`\_pdf_backend_bdc:nn` Simple wrappers. May need refinement: see <https://chat.stackexchange.com/transcript/message/49970158#49970158>.

```

\_pdf_backend_emc:
2936 \cs_new_protected:Npn \_pdf_backend_bdc:nn #1#2
2937 { \_kernel_backend_literal_page:n { /#1 ~ #2 ~ BDC } }
2938 \cs_new_protected:Npn \_pdf_backend_emc:
2939 { \_kernel_backend_literal_page:n { EMC } }

```

(End definition for `\_pdf_backend_bdc:nn` and `\_pdf_backend_emc:.`)

```

2940 </luatex | pdftex>

```

### 6.4 dvipdfmx backend

```

2941 <*dvipdfmx | xetex>

```

`\_pdf_backend:n` A generic function for the backend PDF specials: used where we can.

```

\_pdf_backend:x
2942 \cs_new_protected:Npx \_pdf_backend:n #1
2943 { \_kernel_backend_literal:n { pdf: #1 } }
2944 \cs_generate_variant:Nn \_pdf_backend:n { x }

```

(End definition for `\_pdf_backend:n`.)

## 6.4.1 Catalogue entries

```

\__pdf_backend_catalog_gput:nn
\__pdf_backend_info_gput:nn
2945 \cs_new_protected:Npn \__pdf_backend_catalog_gput:nn #1#2
2946 { \__pdf_backend:n { put ~ @catalog << /#1 ~ #2 >> } }
2947 \cs_new_protected:Npn \__pdf_backend_info_gput:nn #1#2
2948 { \__pdf_backend:n { docinfo << /#1 ~ #2 >> } }

(End definition for \__pdf_backend_catalog_gput:nn and \__pdf_backend_info_gput:nn.)

```

## 6.4.2 Objects

\g\_\_pdf\_backend\_object\_int For tracking objects to allow finalisation.

```

\g__pdf_backend_object_prop
2949 \int_new:N \g__pdf_backend_object_int
2950 \prop_new:N \g__pdf_backend_object_prop

(End definition for \g__pdf_backend_object_int and \g__pdf_backend_object_prop.)

```

\\_\_pdf\_backend\_object\_new:nn Objects are tracked at the macro level, but we don't have to do anything at this stage.

```

(End definition for \\_pdf\_backend\_link\_margin:n.)

`\_pdf_backend_destination:nn`  
`\_pdf_backend_destination:nmmn`  
`\_pdf_backend_destination_aux:nmmn`

Here, we need to turn the zoom into a scale. The method for `FitR` is from Alexander Grahn: the idea is to avoid needing to do any calculations in `TeX` by using the backend data for `@xpos` and `@ypos`. `/FitR` without rule spec doesn't work, so it falls back to `/Fit` here.

```

3048 \cs_new_protected:Npn \_pdf_backend_destination:nn #1#2
3049 {
3050   \_pdf_backend:x

(End definition for `\_pdf_backend_bdc:nn` and `\_pdf_backend_emc:`.)

```
3161 </divsvgm>
```

```
3162 </package>
```

## 7 l3backend-opacity Implementation

```
3163 <*package>
3164 <@=opacity>
```

Although opacity is not color, it needs to be managed in a somewhat similar way: using a dedicated stack if possible. Depending on the backend, that may not be possible. There is also the need to cover fill/stroke setting as well as more general running opacity. It is easiest to describe the value used in terms of opacity, although commonly this is referred to as transparency.

```
3165 <*dvips>
```

`\_opacity_backend_select:n` No stack so set values directly. The need to deal with Distiller and Ghostscript separately means we use a common auxiliary: the two systems require different PostScript for transparency. This is of course not quite as efficient as doing one test for setting all transparency, but it keeps things clearer here. Thanks to Alex Grahn for the detail on testing for GhostScript.

```

3306 \cs_new_protected:Npn \__opacity_backend:nn #1#2
3307   { \__kernel_backend_scope:x { #2 opacity = " \fp_eval:n { min(max(0,#1),1) } " } }

(End definition for \__opacity_backend_select:n and others.)

3308 </dvisvgm>
3309 </package>

```

## 8 l3backend-header Implementation

```

3310 <*dvips & header>

color.sc Empty definition for color at the top level.
3311 /color.sc { } def

(End definition for color.sc. This function is documented on page ??.)

TeXcolorseparation Support for separation/spot colors: this strange naming is so things work with the color
separation stack.
3312 TeXDict begin
3313 /TeXcolorseparation { setcolor } def
3314 end

(End definition for TeXcolorseparation and separation. These functions are documented on page ??.)

pdf.globaldict A small global dictionary for backend use.
3315 true setglobal
3316 /pdf.globaldict 4 dict def
3317 false setglobal

(End definition for pdf.globaldict. This function is documented on page ??.)

pdf.cvs Small utilities for PostScript manipulations. Conversion to DVI dimensions is done here
pdf.dvi.pt to allow for Resolution. The total height of a rectangle (an array) needs a little maths,
pdf.pt.dvi in contrast to simply extracting a value.
pdf.rect.ht
3318 /pdf.cvs { 65534 string cvs } def
3319 /pdf.dvi.pt { 72.27 mul Resolution div } def
3320 /pdf.pt.dvi { 72.27 div Resolution mul } def
3321 /pdf.rect.ht { dup 1 get neg exch 3 get add } def

(End definition for pdf.cvs and others. These functions are documented on page ??.)

pdf.linkmargin Settings which are defined up-front in SDict.
pdf.linkdp.pad
pdf.linkht.pad
3322 /pdf.linkmargin { 1 pdf.pt.dvi } def
3323 /pdf.linkdp.pad { 0 } def
3324 /pdf.linkht.pad { 0 } def

```

(End definition for `pdf.linkmargin`, `pdf.linkdp.pad`, and `pdf.linkht.pad`. These functions are documented on page ??.)

`pdf.rect` Functions for marking the limits of an annotation/link, plus drawing the border. We  
`pdf.save.ll` separate links for generic annotations to support adding a margin and setting a minimal  
`pdf.save.ur` size.

```

pdf.save.linkll 3325 /pdf.rect
pdf.save.linkur 3326 { /Rect [ pdf.llx pdf.lly pdf.urx pdf.ury ] } def
pdf.llx         3327 /pdf.save.ll

                3360 def

```

(End definition for `pdf.rect` and others. These functions are documented on page ??.)

`pdf.dest.anchor` For finding the anchor point of a destination link. We make the use case a separate  
`pdf.dest.x` function as it comes up a lot, and as this makes it easier to adjust if we need additional  
`pdf.dest.y` effects. We also need a more complex approach to convert a co-ordinate pair correctly  
`pdf.dest.point` when defining a rectangle: this can otherwise be out when using a landscape page.  
`pdf.dest2device` (Thanks to Alexander Grahn for the approach here.)

```

pdf.dev.x       3361 /pdf.dest.anchor
pdf.dev.y       3362 {
pdf.tmpa       3363   currentpoint exch
pdf.tmpb       3364   pdf.dvi.pt 72 add
pdf.tmpc
pdf.tmpd

```

```

3393 pdf.dev.y add
3394 }
3395 def

```

*(End definition for pdf.dest.anchor and others. These functions are documented on page ??.)*

pdf.bordertracking	To know where a breakable link can go, we need to track the boundary rectangle. That
pdf.bordertracking.begin	can be done by hooking into a and x operations: those names have to be retained. The
pdf.bordertracking.end	boundary is stored at the end of the operation. Special effort is needed at the start and
pdf.leftboundary	end of pages (or rather galleys), such that everything works properly.
pdf.rightboundary

**pdf.breaklink** Dealing with link breaking itself has multiple stage. The first step is to find the Rect entry in the dictionary, looping over key-value pairs. The first line is handled first, adjusting the rectangle to stay inside the text area. The second phase is a loop over the height of the bulk of the link area, done on the basis of a number of baselines. Finally, the end of the link area is tidied up, again from the boundary of the text area.

```

3534 /pdf.breaklink

(End definition for pdf.breaklink and others. These functions are documented on page ??.)

pdf.pdfmark The business end of breaking links starts by hooking into pdfmarks. Unlike hypdvips,  
pdf.pdfmark.good we avoid altering any links we have not created by using a copy of the core pdfmarks  
pdf.outerbox function. Only mark types which are known are altered. At present, this is purely ANN  
pdf.baselineskip marks, which are measured relative to the size of the baseline skip. If they are more than  
pdf.pdfmark.dict one apparent line high, breaking is applied.
